

Selecting Multiple Objects

There are several methods to select multiple objects from the **Search Results** panel.

- To select multiple objects in the **Search Results** panel:

Option	Description
Select multiple results	<p>Hold the <code>CTRL</code> key and click the results you want to select.</p> <p>In  Thumbnail,  Textual Tile, or  Tile view, hover over the result thumbnails and click their  icons.</p> <p>In  Datagrid view, use the select boxes at the beginning of each row.</p> <div>Warning: This feature is not available in mobile screen resolution (screen width below 700 px).</div>
Select all results	<p>Go to the upper right of the Search Results panel, click  and select  Select all to select all the objects shown in the panel.</p> <p>Note: If the total number of results is higher than 200, this action selects the</p>

Option	Description
	first 200 results. An information message appears saying that only 200 results are selected out of the total number.
Select a range of adjacent results	Click a first result, press the <code>SHIFT</code> key, and click the last result.
Clear your object selection	Use  Unselect all to clear all the objects selected in the Search Results panel.

Notes:

- 3DSearch displays only the intersection of the actions for all selected objects.
- Actions that support a single selection only do not appear, even if the objects selected are of the same type.
